Task / Grade	High Distinction (≥85%)	Distinction (≥75%)	Credit (≥65%)	Pass (≥50%)	Fail
Task 1. **Use Case Description** **(3 marks)**	The use case is clearly situated within an organisational context, with highly relevant background information about the organisation, sector, or operational environment. The use case is clearly described, with the key challenges clearly identified and explained. A clear and well-reasoned justification is provided for why an IoT solution is needed to address the challenges. A comprehensive list of highly relevant references is provided to support the description.	The use case is situated within an organisational context, with some relevant background information about the organisation, sector, or operational environment. The use case is described, with the key challenges or problems identified and explained. A clear justification is provided for why an IoT solution is needed to address the challenges. A list of relevant references is provided to support the description.	The organisational context is identified, but background information about the organisation, sector, or operational setting is limited. The use case is described, with some challenges or problems identified. A justification is provided, but the relevance of an IoT solution to the identified challenges is limited. Some references are included, but their relevance to support the description is limited.	The organisational context is briefly mentioned, but little or no background information is provided. The use case description is basic, with limited discussion of challenges or problems. A justification is provided, but the relevance of an IoT solution to challenges is unclear. Few references are included, or they are not relevant.	The organisational context is unclear or missing. The use case is poorly described or absent, where challenges or problems are not identified. The justification for the IoT solution is unclear or missing. References are missing or inappropriate.
Task 2. Solution Overview **(4 marks)**	A concise and well-articulated overview of the proposed IoT solution is provided, clearly explaining how the solution operates and how it addresses the identified challenges. The people (stakeholders) involved are clearly identified, and their roles and relevance to the solution are thoroughly explained.	A clear overview of the proposed IoT solution is provided, showing good alignment with the identified challenges. The people (stakeholders) involved are identified, with a reasonable explanation of their roles and relevance to the solution.	The proposed IoT solution is introduced, but the explanation lacks clarity or clear alignment with the identified challenges. The people (stakeholders) are identified, but their roles and relevance require further explanation.	A possible solution is mentioned, but it lacks clarity or alignment to the identified challenges. The people (stakeholders) are mentioned, but their roles in the solution are vague or insufficiently explained.	The proposed solution is missing, vague, or irrelevant to the identified challenges. The people (stakeholders) are missing, incorrectly identified, or their relevance is not explained.

Task 3. Value Proposition **(8 marks)**	The value proposition is fully developed, well-structured, and effectively utilises the provided template.	The value proposition is well-developed and mostly complete, with minor issues, while correctly using the provided template.	The value proposition is partially completed and demonstrates some use of the provided template.	The value proposition contains several gaps and may misuse or incompletely apply the provided template.	The value proposition is missing, mostly irrelevant, or demonstrates minimal understanding of the template. **Failure to use the provided template will receive a zero mark.**
