IOT SOLUTION PLANNING

Design of Enterprise IoT: Assignment 1a

OBJECTIVE

In this assignment, you will focus on the **planning phase of an IoT solution design**.

You will identify a suitable use case in an industry or government context that can benefit from deploying an IoT solution (Task 1), provide an overview of your IoT solution (Task 2), and present the value of the proposed solution (Task 3).

TASK 1: USE CASE DESCRIPTION (MAX 150 WORDS) [3 MARKS]

Identify a **use case** in an **industry or government context** where an IoT solution could provide benefit to organisations. Your description should include:

(i) The organisation context (e.g., industry sector or government)
(ii) The use case description
(iii) The rationale for proposing an IoT solution

Your use case must be supported by credible and reliable sources, such as scientific papers, industry white papers, government reports, or authoritative web sources. You must **cite and reference the sources** used.

[Note] As this assignment focuses on the **planning stage of an IoT solution design**, use cases that would potentially lead to a **fully integrated solution** should be avoided, as they will create difficulties in completing the next assignment. **Examples** include solutions centred on a single product with all-in-one, built-in smart functionality, such as a mobile smart device with fully integrated features or a vehicle with fully embedded technology.

TASK 2: SOLUTION OVERVIEW (MAX 150 WORDS) [4 MARKS]

Based on the use case identified in Task 1:

(i) Provide an overview of your IoT solution and how the solution would operate
(ii) Identify the people (stakeholders) involved in the proposed solution

TASK 3: VALUE PROPOSITION [8 MARKS]

Develop a value proposition for the IoT solution proposed in Task 2. You must present your value proposition using the provided template (**Template-1_Value-Proposition.docx**). **Failure to use the template will result in a zero mark for this task.**
