Task / Grade		High Distinction (≥85%)	Distinction (≥75%)	Credit (≥65%)	Pass (≥50%)	Fail
Task 1. Solution Overview **(2 marks)**		A concise, well-structured, and well-articulated overview of the proposed IoT solution is provided, with key features clearly and specifically described.	A clear overview of the proposed IoT solution is provided, with the key features described.	The proposed IoT solution is introduced, but the description of key features is limited or lacks sufficient detail.	A possible solution is mentioned, but the description of key features is vague, generic, or weakly connected to the proposed solution.	The proposed solution is missing, unclear, or irrelevant, and key features are not identified.
Task 2. IoT Devices **(10 marks)**	**Task 2.1** **(2 marks)**	A clear and concise overview of the selected devices is provided, with a strong, well-justified explanation of their suitability for the solution, clearly addressing relevant information in the value proposition.	A well-organised and concise overview of the selected devices is provided, with a good explanation of their suitability for the solution, though some aspects may be unclear in relation to the value proposition.	An overview of the selected devices is provided, but the explanation of their suitability is somewhat general or lacks some clarity in relation to the value proposition.	An overview of the selected devices is provided, but the explanation of their suitability is vague, incomplete, or lacks a connection to the value proposition.	An overview of the selected devices is missing, irrelevant, or lacks any explanation of their suitability for the solution and connection to the value proposition.
	Task 2.2 **(8 marks)**	A well-developed specification of the selected devices is presented using the provided template, with all devices properly cited. All required elements of device selection are clearly addressed.	A clear and structured specification of the selected devices is presented using the provided template, with most devices properly cited. Most required elements of device selection are addressed with good clarity.	A basic, complete specification of the selected devices is presented using the provided template, with some citations missing or incomplete. Some required elements of device selection are covered, but with noticeable gaps.	A partially completed specification of the selected devices is presented using the provided template, with key citations missing or incomplete. Several required elements of device selection are missing or insufficiently addressed.	The specification of the selected devices is missing, incomplete, or lacks relevance, with little or no proper citation. Most or all required elements of device selection are absent. **Failure to use the provided template will receive a zero mark.**

Task / Grade		High Distinction (≥85%)	Distinction (≥75%)	Credit (≥65%)	Pass (≥50%)	Fail
Task 3: IoT Network Technologies **(8 marks)**	**Determine the connectivity between IoT devices and network devices** **(2 marks)**	A clear and well-reasoned explanation is provided using the provided template, demonstrating an excellent understanding of the purpose of connecting IoT devices to the network devices.	A clear explanation is provided using the provided template, demonstrating a good understanding of the purpose of connecting IoT devices to the network devices.	A basic explanation is provided using the provided template, demonstrating a partial understanding of the purpose of connecting IoT devices to the network devices.	A limited explanation is provided using the provided template, showing a weak understanding of the purpose of connecting IoT devices to the network devices.	The explanation is missing or irrelevant. There is no meaningful justification for connecting the IoT devices to the network.
	Determine communication and network technologies required to support connectivity **(6 marks)**	All key factors are clearly and appropriately justified based on the scenario. A well-reasoned final decision is provided, with an integrated explanation that draws on all factors and demonstrates a clear understanding of the selection process.	Most key factors are appropriately justified based on the scenario, and a clear final decision is presented. The explanation reflects an attempt to draw on multiple factors, though some are not fully elaborated.	Some key factors are justified based on the scenario, but the reasoning is partially developed. A final decision is given, but the explanation is general, with limited discussion on how multiple factors are drawn upon.	A few key factors are briefly mentioned but lack justification based on the scenario. The final decision is stated but not well explained, and there is little or no discussion on how multiple factors are drawn upon.	The justification for key factors is missing, irrelevant, or incorrect. No clear final decision is made, or the explanation does not reflect any understanding of the selection process. **Failure to use the provided template will receive a zero mark.**

Task / Grade		High Distinction (≥85%)	Distinction (≥75%)	Credit (≥65%)	Pass (≥50%)	Fail
Task 4. Fog and Cloud Computing **(10 marks)**	**Determine the connectivity between IoT devices, network devices in the edge/fog layer, and to the cloud** **(2 marks)**	A well-developed justification of the fog and/or cloud computing in the proposed solution is presented using the provided template, demonstrating an excellent understanding of connectivity and data flow between IoT devices, network devices, the fog layer, and the cloud layer.	A clear justification of the fog and/or cloud computing in the proposed solution is presented using the provided template, demonstrating a good understanding of the connectivity and data flow between IoT devices, network devices, the fog layer, and the cloud layer.	A basic justification of the fog and/or cloud computing in the proposed solution is presented using the provided template, demonstrating an essential understanding of the connectivity and data flow between IoT devices, network devices, the fog layer, and the cloud layer.	A limited justification of the fog and/or cloud computing in the proposed solution is presented using the provided template, showing a partial understanding of the connectivity and data flow between IoT devices, network devices, the fog layer, and the cloud layer.	No valid justification of the fog and/or cloud computing in the proposed solution is provided. No meaningful understanding of fog/cloud computing or the data flow across layers.
	Determine data processing and/or analysis tasks and user/system applications across IoT devices, fog and cloud layers **(8 marks)**	A comprehensive justification of data, processing tasks, and user/system applications across IoT devices, fog, and cloud layers is provided. The explanation is well-structured and logically presented.	A clear justification of data processing tasks and user/system applications across IoT devices, fog, and cloud layers is provided. The explanation is mostly well-structured and logically presented with minor gaps.	A basic justification of data processing tasks and user/system applications across IoT devices, fog, and cloud layers is provided. The explanation is partially structured and presented with noticeable gaps.	A limited justification of data processing tasks and user/system applications across IoT devices, fog, and cloud layers is provided. The explanation is loosely structured and lacks clarity.	No valid justification for data processing tasks or user/system applications across IoT devices, fog, and cloud layers is provided. The explanation is missing, irrelevant, or incorrect. **Failure to use the provided template will receive a zero mark.**

Task / Grade		High Distinction (≥85%)	Distinction (≥75%)	Credit (≥65%)	Pass (≥50%)	Fail
Task 5: IoT connectivity diagram **(6 marks)**	**Task 5.1** **(4 marks)**	The diagram is clear, well-structured, and visually coherent. It accurately illustrates all key components along with data transmission flows. All components and data transmission flows are appropriately labelled, aligning with the device selection and IoT connectivity design.	The diagram is mostly clear, well-structured, and visually coherent. It illustrates most key components along with data transmission flows, with minor gaps. Most components and data transmission flows are appropriately labelled, with minor inconsistencies in alignment with the device selection and IoT connectivity design.	The diagram is somewhat clear and structured but lacks full visual coherence. It illustrates some key components along with data transmission flows, with noticeable gaps. Some components and data transmission flows are labelled, but there are noticeable inconsistencies or gaps in alignment with the device selection and IoT connectivity design.	The diagram lacks clarity, structure, or visual coherence. It illustrates limited key components and data transmission flows, with significant gaps. Few components and data transmission flows are labelled, with significant inconsistencies or gaps in alignment with the device selection and IoT connectivity design.	No relevant or valid diagram is provided. It fails to illustrate key components and data transmission flows. Components and data transmission flows are largely unlabeled, incorrect, or have no labels.
	Task 5.2 **(2 marks)**	A clear, concise, and well-structured description of the IoT connectivity diagram is provided.	A clear description of the IoT connectivity diagram is provided.	A basic description of the IoT connectivity diagram is provided but lacks depth in explaining how the system operates.	The description of the IoT connectivity diagram is vague or incomplete.	No clear or missing description of the IoT connectivity diagram is provided.

Task / Grade		High Distinction (≥85%)	Distinction (≥75%)	Credit (≥65%)	Pass (≥50%)	Fail
Task 6: Conclusion **(2 marks)**	**Summary** **(1 mark)**	A clear and concise summary is provided, effectively explaining how the solution design reflects the IoT solution plan.	A reasonably clear summary is provided, explaining how the solution design reflects the IoT solution plan.	A basic summary is provided, partially explaining how the solution design reflects the IoT solution plan, with noticeable gaps or lack of clarity.	A limited summary is provided, with a weak explanation of how the solution design reflects the IoT solution plan, missing key points.	No clear summary is provided, or the explanation fails to address how the solution design reflects the IoT solution plan.
	Limitation **(1 mark)**	A clear and concise discussion of the limitations is provided, effectively highlighting what the solution cannot do or situations it cannot address.	A reasonably clear discussion of the limitations is provided, highlighting what the solution cannot do or situations it cannot address, with minor gaps.	A basic discussion of the limitations is provided, partially highlighting what the solution cannot do or situations it cannot address, with noticeable gaps or lack of clarity.	A limited discussion of the limitations is provided, with a weak explanation of what the solution cannot do or situations it cannot address, missing key points.	No clear discussion of the limitations is provided, or the explanation fails to highlight what the solution cannot do or situations it cannot address.
Report Presentation and Formatting **(2 marks)**		The report is well-structured, logically organised, professionally presented, and highly coherent between sections.	The report is well-structured, professionally presented, and generally coherent, with minor areas for improvement.	The report has a basic structure, adequate presentation, and some coherence but lacks clarity.	The report lacks clear structure, with weak presentation and limited coherence between sections.	The report is poorly structured and organised, unprofessionally presented, with little to no coherence between sections.
